Thymosin-4 is primarily co-localised with CD31 in the ventricle wall. Triple fluorescent immunostaining of fetal ventricle sections for T4 (A), CD31 (B), an endothelial cell marker, and MHC (C). DAPI nuclear counterstain is also shown (D). The staining pattern of T4 is similar to that of CD31, with large areas of co-localisation (E). Neither T4 nor CD31 co-localises with MHC (closed arrows). Representative of six individual hearts (7-12 pcw). Scale bar = 40 µm.
