## Background/Target Information

B cell linker protein (Blnk) is a protein encoded by the Blnk gene located on chromosome 10 in humans. It is also known as SLP 65 (Src homology 2 domain-containing leukocyte protein of 65 kDa). It derives its name from being an adaptor protein in the B cell receptor signaling cascade with several supporting studies showing improper development of B cells in the absence of Blnk. Blnk undergoes tyrosine phosphorylation by Syk, a B cell receptor activated kinase, which provides a platform for interaction of signaling intermediaries such as the Vav GEF and Grb2.
